

Stop Tracking. Start Warning.

One page. One decision about what Orion refuses to be. Prepared for Karl · June 2026

THE NORTH STAR — ONE SENTENCE

"Orion tells you what breaks your portfolio — before it breaks it."

Not a net-worth tracker (that race is lost to Empower, Kubera, Monarch). Orion is the **risk early-warning system** serious investors check before they can sleep. It is the one column where every competitor scored "Weak" and you scored "Strong." Own it. Everything else is plumbing that feeds it.

Who it's for — exactly one user

- **The serious self-directed investor** with real money (six figures+) and a real fear of the next 2008 / 2022.
- Has no tool that tells them their actual exposure. Uses a spreadsheet and hope.
- Not beginners, not "everyone with a Robinhood account." Pick the person who is *afraid*, because fear is the strongest reason to return daily.

The job it does — exactly one

- Answer the question no dashboard answers: **"What is most likely to hurt me, and how badly?"**
- Surface the risk *building over time* — concentration creep, rate exposure, a factor quietly dominating the book.
- Turn a vague 2am worry into a ranked, dollar-quantified, do-this-now answer.

The spine — the only three things that get top billing

1

The Risk Engine

"What breaks you first," ranked by \$ impact. The Stress Lab, factor exposure, concentration, rate-sensitivity curve. This is the product — not a tab inside it.

2

The Warning Briefing

Not "good morning, here's your wealth." Instead: "Your emerging risk this week — tech concentration just crossed the line that cost 31% in 2022." Same AI, a reason to be afraid not to open it.

3

Memory & Trust

Accounts + persistence + reliable data. You can't warn about a risk that builds over time if you forget the portfolio every session. The boring foundation now has an obvious *why*.

Demote to plumbing — inputs, never the hero

- Net-worth / holdings table — feeds the engine, never the headline
- Wealth Map treemap — keep only as a risk lens (concentration), not décor
- Income calendar, performance — earn their place only if they expose a risk
- CSV import / aggregation — the on-ramp, kept invisible and fast

The kill-list — cut or never build

- Anything framed as "track / glance at your wealth" — that's the lost race
- Live markets charts & index browsing — that's a different app
- Tax / estate "findings" as a headline — niche, simple, liability, off-mission
- Every new asset class or analytic that doesn't end in a *warning*
- "For everyone" copy — it serves the middle of no one

The one gate every future feature must pass

"Does this help someone see or avoid a portfolio risk?" If no, it does not ship — no matter how cool, and that includes ideas handed to you by advisors, investors, or AI. You never lacked features. You lacked a reason to say no. This is it.

5.4 → ~7.5

Why focus raises the score: the PM lens rewards serving one user doing one job; the moat lens rewards "the risk engine no one else has" over a clonable dashboard; retention rewards fear (a daily trigger) over curiosity (a one-time one); and auth/persistence/data finally have a reason to exist. You don't climb by adding. You climb by refusing.
